C/Java Syntax

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

By the end of this lecture, you will be able to identify the different parts of a C program. You will also be able to create a simple C program.

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

Lecture 02 Summary

- Keywords
- Variable Declarations
- Data Types
- Operators
- Statements
 - if, switch, while, do-while, for
- Functions

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

What is a keyword?

What are some of the keywords in Python?

January 13, 2009

Keywords in C (all 32 of them)

auto	double	int	struct
break	else	long	switch
case	enum	register	typedef
char	extern	return	union
const	float	short	unsigned
continue	for	signed	void
default	goto	sizeof	volatile
do	if	static	while

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock)

Variable Declarations

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

In Python...

which lines are okay?

```
1var = 5
    _pi = 3.1415
    str+ing = "hello"
while = 3.3
x = '0'
myStr2 = "I'm a string"
```

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

C Variable Names

- Start with a letter or underscore
- Subsequent characters can also be numbers
- Can't use reserved keywords
- Case sensitive
 - mystring is not the same as myString

January 13, 2009

C Declarations

 Must specify the type of the variable (which will never change)

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

11

In Python...

```
x = 5 # x starts out as an integer
```

... more code ...

x = "now I'm a string"

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

In C...

```
int x = 5;
```

... more code ...

x = "Noooooooooo!"

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

Data Types

- Integral Types
 - -char
 - -short
 - -int
 - -long
 - -long long
- Floating Point Types
 - -float
 - -double

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

by Mark Hancock 12

16

Why isn't there just one int and one float type?

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

sizeof Operator

```
main()
{
    printf("int: %d bytes\n", sizeof(int));
}
```

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

13

15

In C...

• which lines are okay?

```
int 1var = 5
float _pi = 3.1415
short str+ing = "hello"
double while = 3.3
char x = '0'
int myStr2 = "I'm a string"
```

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock) Operators

January 13, 2009

What are the operators?

```
int x = 5;
int y = x + 10;
int z = (x + 20) / y;
if (z < x)

z = x * y;
```

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

17

Operators in C

Operator	Description	
++	postfix increment and decrement	
()	function call	
[]	array subscription	
->	element selection through pointer	
++	prefix increment and decrement	
+-	unary plus and minus	
!~	logical not, bitwise not	
(type)	type cast	
*	indirection/dereferencing of pointer	
&	address of	
sizeof	get the size of element	
*/%	multiplication, division, modulus	
January 13, 2009	Slides by Mark Hancock (adapted from notes by Craig Schock)	18

Operators in C (cont'd)

Operator	Description	
•	<u> </u>	
+-	addition and subtraction	
<< >>	bitwise shift left and right	
< <= > >=	less than, less than equals, greater than, greater than equals	
== !=	equals, not equals	
&	bitwise AND	
٨	bitwise XOR (exclusive-or)	
l	Bitwise OR	
&&	Logical AND	
H	Logical OR	
cond?t:f	ternary command	
= += -= *= /= %=	Assignment operators	

(adapted from notes by Craig Schock)

Increment and Decrement

int i = 0;

Slides by Mark Hancock January 13, 2009 (adapted from notes by Craig Schock)

What will this output?

```
main()
{
    int x = 5;
    int y = 20;

    x++;
    y--;

    printf("x = %d\n", x);
    printf("y = %d\n", y);
}
January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)
```

Prefix vs. Postfix

- Prefix = first thing that happens (before)
 e.g., ++i
- Postfix = last thing that happens (after)
 e.g., i++

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

Prefix vs. Postfix Example

```
main()
{
    int x = 5;
    int y = 5;
    int a;
    int b;

    a = x++; /* postfix */
    b = ++y; /* prefix */

    printf("a = %d\n", a);
    printf("b = %d\n", b);
    printf("x = %d\n", x);
    printf("y = %d\n", y);
}

January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)
23
```

What will this output?

```
main()
{
    int i = 70;
    int j = 42;

    int a = i++ * ++j;

    printf("i = %d\n", i);
    printf("j = %d\n", j);
    printf("a = %d\n", a);
}
Slides by Mark Hancock
(adapted from notes by Craig Schock)
```

Statements

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

25

In Python...

```
def farenheit_to_celcius(temp):
    return (temp - 32.0) * (5.0 / 9.0)

print "Enter the temperature in Farenheit:"
temp = input()

if temp < -459.67:
    print "It can't possibly be that cold!"
else:
    tempInCelcius = farenheit_to_celcius(temp)
    print "In Farenheit: %f" % temp
    print "In Celcius: %f" % tempInCelcius</pre>
```

Enter "72"

In C...

- Simple statements end with a semi-colon (;)
- Any white space is ignored by the computer
 - spaces, tabs, new lines
 - but is very helpful to *people* who read the code

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

$\verb|if Statement Syntax|\\$

```
if (<conditional>)
    <what-to-do-if-true>;
else
    <what-to-do-if-false>;
```

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

29

Example

```
main()
      int x = 3;
     if (x % 2 == 0)
           printf("x is even\n");
     else
           printf("x is odd\n");
                          Slides by Mark Hancock
January 13, 2009
                                                              30
                      (adapted from notes by Craig Schock)
```

Example

```
main()
int x = 3;
if (x \% 2 == 0)
printf("x is even\n");
printf("x is odd\n");
                          Slides by Mark Hancock
January 13, 2009
                                                                31
                       (adapted from notes by Craig Schock)
```

Example

```
main() { int x = 3; if (x % 2 == 0) printf(
"x is even\n"); else printf("x is odd\n");}
                      Slides by Mark Hancock
January 13, 2009
                                                       32
```

(adapted from notes by Craig Schock)

How would we write this in C?

```
if temp < -459.67:
    print "It can't possibly be that cold!"
else:
    tempInCelcius = farenheit to celcius(temp)
    print "In Farenheit: %f" % temp
    print "In Celcius: %f" % tempInCelcius
                        Slides by Mark Hancock
January 13, 2009
```

(adapted from notes by Craig Schock)

Would this work?

```
if (temp < -459.67)
    printf("It can't possibly be that cold!\n");
else
    tempInCelcius = farenheit to celcius(temp);
    printf("In Farenheit: %f\n", temp);
    printf("In Celcius: %f", tempInCelcius);
                         Slides by Mark Hancock
January 13, 2009
                                                              34
                      (adapted from notes by Craig Schock)
```

Compare it to this

```
if (temp < -459.67)
    printf("It can't possibly be that cold!\n");
    tempInCelcius = farenheit to celcius(temp);
printf("In Farenheit: %f\n", temp);
printf("In Celcius: %f", tempInCelcius);
                         Slides by Mark Hancock
January 13, 2009
                      (adapted from notes by Craig Schock)
```

Blocks

33

• Statements can be grouped together into a compound statement by enclosing them in curly braces ({})

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

Adjusted if Statement Syntax

How would we write this in C?

```
if temp < -459.67:
    print "It can't possibly be that cold!"
else:
    tempInCelcius = farenheit_to_celcius(temp)
    print "In Farenheit: %f" % temp
    print "In Celcius: %f" % tempInCelcius</pre>

January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)

38
```

Answer

```
if (temp < -459.67)
{
    printf("It can't possibly be that cold!\n");
}
else
{
    tempInCelcius = farenheit_to_celcius(temp);
    printf("In Farenheit: %f\n", temp);
    printf("In Celcius: %f", tempInCelcius);
}

January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)
39</pre>
```

Consider this code...

```
if (x > 50)
   if (y > 200)
      z = x * y;
else
   printf("error!\n");
```

• Which if does the else belong to?

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock)

Good Practice if (x > 50) { if (y > 200) { z = x * y; } else { printf ("error!\n"); } }

Slides by Mark Hancock

(adapted from notes by Craig Schock)

else if and switch Statements

January 13, 2009

41

Slides by Mark Hancock (adapted from notes by Craig Schock)

What would this do?

January 13, 2009

What would this do?

```
int x = 3;

if (x == 1)
    printf("One!\n");
else if (x == 2)
    printf("Two!\n");
else if (x == 3)
    printf("Three!\n");
else
    printf("Not one, two, or three");
```

$\verb|switch| \textbf{Statement Syntax}|$

```
switch (<variable>)
     case <value-one>:
          <code>;
          <code>;
          break;
     case <value-two>:
          <code>;
          <code>;
          break;
     default:
          <code>;
          break;
                          Slides by Mark Hancock
January 13, 2009
                                                              45
                      (adapted from notes by Craig Schock)
```

Example

```
int x = 3;
switch (x)
    case 1:
         printf("One!\n");
         break;
    case 2:
         printf("Two!\n");
         break;
    case 3:
         printf("Three!\n");
    default:
         printf("Invalid choice!\n");
                            Slides by Mark Hancock
January 13, 2009
                                                                     46
                         (adapted from notes by Craig Schock)
```

Loops

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock) 47

Example

Factorial

```
- n! = n · (n-1) · (n-2) · ... · 3 · 2 · 1
```

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock)

Complete this Python program

```
print "Enter a number greater than zero:"
n = input()
                     Slides by Mark Hancock
```

(adapted from notes by Craig Schock)

49

while Syntax while (<condition>) <statement> Slides by Mark Hancock January 13, 2009 50 (adapted from notes by Craig Schock)

What do you think this would do?

January 13, 2009

```
main()
      int i = 0;
      while (i < 10)
            printf("i = %d\n", i);
            i++;
                            Slides by Mark Hancock
January 13, 2009
                                                                    51
                        (adapted from notes by Craig Schock)
```

Without the infinite loop

```
main()
      int i = 0;
      while (i < 10)
            printf("i = %d\n", i);
            i++;
                            Slides by Mark Hancock
January 13, 2009
                                                                    52
                        (adapted from notes by Craig Schock)
```

Complete this C Program

```
main()
{
   int n;
   printf("Enter a number greater than zero: ");
   scanf("%d", n);
   ...
}

January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)

53
```

do-while Syntax

```
do
{
     <statement>;
     <statement2>;
} while (<condition>);

January13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)

54
```

Compare

for Syntax

- <a> = Initialization of looping variable
- = Condition
- <c> = Modification of looping variable

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock)

For Loops

Example

```
int i;
for (i = 0; i < 5; i++)
{
    printf("%d\n", i);
}</pre>
```

(adapted from notes by Craig Schock)

Complete this C Program

```
main()
{
   int n;
   printf("Enter a number greater than zero: ");
   scanf("%d", n);
   ...
}

January 13, 2009

Slides by Mark Hancock
(adapted from notes by Craig Schock)

59
```

Functions

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock) 60

64

Functions in C

- Must specify what type is returned
 if there is no return statement, must return void
- Must specify the type of each parameter

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

61

Function Syntax

January 13, 2009

Slides by Mark Hancock (adapted from notes by Craig Schock)

Examples

```
int add(int x, int y)
{
    return x + y;
}

void print_int(int i)
{
    printf("%d\n", i);
}
January 13, 2009

Slides by Mark Hancock
(adapted from notes by Cralig Schock)
63
```

Remember from before

```
def farenheit_to_celcius(temp):
    return (temp - 32.0) * (5.0 / 9.0)
```

January 13, 2009

What would it look like in C?

```
def farenheit_to_celcius(temp):
    return (temp - 32.0) * (5.0 / 9.0)
```

65

What would it look like in C?

```
float farenheit_to_celcius(float temp)
{
    return (temp - 32.0) * (5.0 / 9.0);
}

January 13, 2009
Slides by Mark Hancock
66
```

(adapted from notes by Craig Schock)

January 13, 2009 Slides by Mark Hancock (adapted from notes by Craig Schock)

What is main? Slides by Mark Hancock (adapted from notes by Craig Schock) 67

Variants of main

```
void main()
{
}
int main()
{
    return 0;
}
int main(int argc, char **argv)
{
    return 1;
}
January 13, 2009

Slides by Mark Hancock
(adapted from notes by Cralig Schock)
68
```

Write this whole program in C

```
def farenheit_to_celcius(temp):
    return (temp - 32.0) * (5.0 / 9.0)

print "Enter the temperature in Farenheit:"
temp = input()

if temp < -459.67:
    print "It can't possibly be that cold!"
else:
    tempInCelcius = farenheit_to_celcius(temp)
    print "In Farenheit: %f" % temp
    print "In Celcius: %f" % tempInCelcius</pre>
```

Identify the different parts

```
int max(int a, int b)
    if (a > b)
        return a;
        return b;
void main()
    int first;
    int second;
    int bigger;
    printf("Enter a number: ");
    scanf("%d", &first);
    printf("Enter another number: ");
    scanf("%d", &second);
    bigger = max(first, second);
    printf("The bigger number is: %d\n", bigger);
                            Slides by Mark Hancock
January 13, 2009
                                                                    70
                        (adapted from notes by Craig Schock)
```

Keywords

```
int max(int a, int b)
     if (a > b)
         return a;
     else
          return b;
void main()
     int first;
     int second;
    int bigger;
    printf("Enter a number: ");
    scanf("%d", &first);
printf("Enter another number: ");
scanf("%d", &second);
    bigger = max(first, second);
    printf("The bigger number is: %d\n", bigger);

Create a Program in C

- Input:
 - three floating point numbers
- Output:
 - the average of those three numbers
- Use:
 - scanf to get the input
 - printf to show the result
 - a function to calculate the average
