1

By the end of this lecture, you will be able to describe what a **thread** is and understand how threads work in Java.

2

Question: In the programs we have created so far, how many statements are executed **at the same time**?

3

When you use your computer, how many programs do you run at the same time? Why?

4

**Fact:** With only one CPU, only one machine instruction can be executed at a time.

5

**Discussion:** If you were to guess, how do you think it is possible that more than one program can run at the same time on your computer?

6

**Question:** If you wanted to include a picture you received in an email in a presentation you were creating in Keynote, how would you share this information?

## Multi-Tasking

8

What is the overhead?

9

## Threads

- A single program can “simultaneously” execute different **threads** of code
- All of a processes threads **share** the same memory (assigned by the operating system).

## Multi-Threading

11

**Discussion:** What would be the benefit of multi-tasking over multi-threading?

12

## Example: Web Servers

- A web server takes requests from the Internet
- Each request must be handled in turn

13

How does the **grocery store** handle many requests from people wanting to pay for their groceries?

14

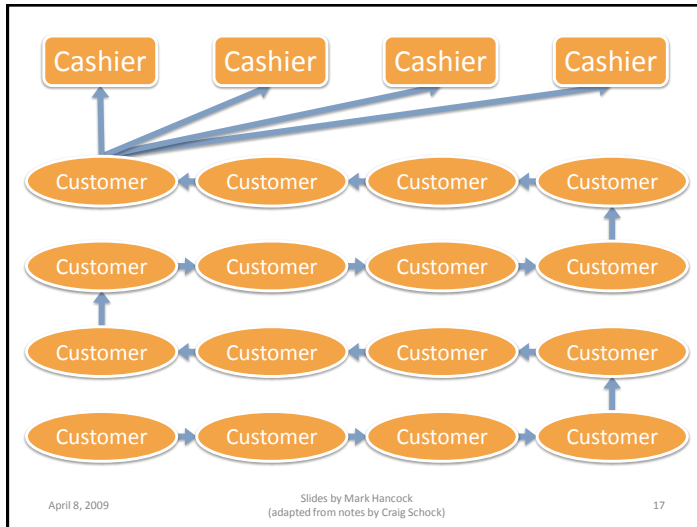

How does the **bank** handle many requests from people wanting to do transactions?

15

**Discussion:** What strategies do you use at the grocery store?

## Threads in Java

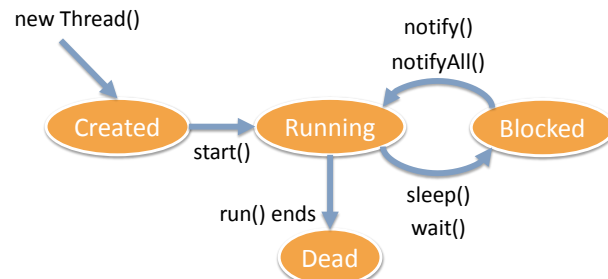

- Java supports multiple threads
- When a Java program is started, the **virtual machine** starts up a main thread
- It **also** sets up other threads to maintain the virtual machine
- Example: garbage collection

## Thread States

23

If you were writing a single program, what would be the benefit of using threads?

April 8, 2009

24

## Starting a new thread

- Instantiate a new **Thread** object
- Invoke the **start()** method on that object

April 8, 2009

25

## Example

```
MyTask aTask = new MyTask();
Thread theThread = null;
if (theThread == null)
{
    theThread = new Thread(aTask);
    theThread.start();
}
```

26

## Runnable Interface

- The **Runnable** interface has one method: **run**

April 8, 2009

Slides by Mark Hancock  
(adapted from notes by Craig Schock)

27

## MyTask.java

```
public class MyTask implements Runnable
{
    public void run()
    {
        while (true)
        {
            // ....
        }
    }
}
```

Why use an infinite loop?

April 8, 2009

28

**Discussion:** Why are there separate **run** and **start** methods, and why don't we just call run directly?

April 8, 2009

Slides by Mark Hancock  
(adapted from notes by Craig Schock)

29

**Discussion:** what issues might arise with the use of the same memory space in different threads?
